Working for people and animals together

### Copper

- Copper is an essential trace element
- Many forages in Britain are low in copper so the risk of copper deficiency on unsupplemented diets is relatively high
- Copper deficiency (hypocupraemia and hypocuprosis) is diagnosed relatively commonly by VLA in beef suckler cattle (546 since 2005)
- Cf. Dairy cattle (0)

ACAF 22<sup>nd</sup> September 2010

---

---

---

---

Working for people and animals together

### Copper deficiency disease

- Hypocupraemia
  - Low blood copper but no clinical signs
- Hypocuprosis
  - Infertility
  - Coat colour alterations
  - Skeletal abnormalities in calves

ACAF 22<sup>nd</sup> September 2010

Building for people and animal health

### Why supplement copper?

- To prevent copper deficiency disease
  - When the copper content of the diet does **not** meet production requirements
  - In the presence of copper antagonists such as molybdenum, iron and sulphur

NCAI 2011 September 2011 4

---

---

---

---

---

---

---

---

Building for people and animal health

### Dairy nutrition

- In general relatively advanced. Nutrition needs to cover maintenance and production (**milk and pregnancy**)
  - Forages
  - Concentrates
  - Straights
  - Minerals
  - TMR
- The modern dairy cow will **virtually never** receive insufficient copper in a ration

NCAI 2011 September 2011 5

---

---

---

---

---

---

---

---

Building for people and animal health

### Infertility in dairy cattle in the UK

- Multifactorial
  - Poor oestrus detection
  - Technical eg **incorrect time of service**
  - Inadequate nutrition eg energy deficit
  - Infectious disease
  - Infections
  - Genetic selection
- Molybdenumosis

NCAI 2011 September 2011 6

---

---

---

---

---

---

---

Building for profit and animal health

### Copper requirement and allowance

- Allowance in diet is always more than the copper requirement
- Provide sufficient copper to fully meet the
  - requirement for maintenance
  - requirement for production
    - 1 copper requirement for milk production relatively low compared with maintenance
    - 2 growing foetus
- In addition, an amount to overcome the effect of copper antagonists
- a small additional amount to provide a safety margin

ACM 201 September 2010 7

---

---

---

Building for profit and animal health

### Possible causes of copper poisoning

- Excessive supplementation
  - Intended
  - Incidentally related to production
- Increased bioavailability and absorption of copper
  - Physical and chemical form of copper
  - Antagonists e.g. soil ingestion
  - Genetics
- Decreased copper excretion
  - Pathology
  - Genetics
- Increased susceptibility to poisoning by copper
  - Concurrent oxidative stress
  - Concurrent liver disease
  - Genetics

ACM 201 September 2010 8

---

---

---

---

---

---

---

---

---

---

Building for profit and animal health

### Evidence of excessive supplementation

- Clinical disease: copper toxicity
- Subclinical disease:
  - Raised liver enzymes but this is non specific
- Analytical:
  - Excessive copper content of compounded feeding stuffs
  - Total daily exposure: multiple supplementation
    - 1 Levels in excess of those permitted without prescription even in absence of known antagonists problem (refer to appendix 2)

---

---

---

---

---

---

---

---

---

Raising the Profile and Awareness

### VLA survey 1999-2003; results of forage and TMR analysis

Evidence of molybdenumosis?

- No evidence of a severe copper antagonist problem on most of the farms
- Only 2 of 10 forages analysed investigated contained "high" concentrations of Mo
- No forages contained high concentrations of S

The presentation of many dietary analytical results is misleading, possibly promoting over interpretation of deficiencies

Raising the Profile and Awareness

### Good supplementation practice

- Confirm the need for supplementation
  - What should the criteria for intervention be?
- Supplement only to the level required
  - Are some supplements superior or safer?
- Consider all sources
- Follow the requirements for a prescription when supplementing above Feed Regulations limits
- Monitor efficacy and safety of supplementation
  - Possibly not as simple as it sounds

ACM 27<sup>th</sup> September 2013 12

---

---

---

---

---

---

---

---

---

---

Working for people and animal health

### Problems encountered following good practice

- Inadequate tests used to diagnose copper deficiency and molybdenumosis
- Failure to monitor liver copper
- Failure to eliminate other causes of infertility
- Failure to use control groups
- Failure to investigate mineral status (Cu, Mo, S, Fe, Zn)

ACAT 2019 September 2019 13

---

---

---

---

Working for people and animal health

### Conclusions

- Implement "Good Practice" to avoid over supplementation
- Design a practical scheme for implementing and monitoring good practice in animal feeding
- Code of Practice
  - Can we agree core procedures to follow?
  - Do we need further advice as to how responsible supplementation could be done?
